ABSTRACT:

PURPOSE: To easily select even a window hidden behind another window and to attain the
selection of windows on a screen equal to an actual window by showing the frames of all
windows regardless of the overlapping state of windows and with no use of a layout
window.

CONSTITUTION: A frame information storage part 3 is provided to store the state of a real
window together with a frame display part 5 which shows the frames of all windows with a
simple operation and regardless of the overlapping state of windows, a frame control part
4 which chooses a frame most approximate to the input coordinates out of the shown frames
and outputs the identification value of the frame, a real window control part 6 which
carries out the selection processing corresponding to the identification value, and a
real window display part 7 which shows the latest real window under the control of the
part 6.
